

Using OpenCPN with the Actisense W2K-1

Using OpenCPN with the Actisense W2K-1

[OpenCPN](#) is a chartplotter software to be used at the helm station of your boat while underway. By using the software with our [W2K-1 NMEA 2000 to WiFi Gateway](#) you can chart your course and track your position right from your laptop.

So how do you connect the W2K-1 to the OpenCPN software? Follow the steps below to get your device up and running in no time.

Setting up the W2K-1

OpenCPN uses NMEA 0183 as it's data format, so the data server(s) on the W2K-1 have to be set up for NMEA 0183.

To do this, follow these simple steps:

1. Ensure your W2K-1 is connected to your NMEA 2000 network and is powered (LEDs indicate this. The device will also show on NMEA Reader in Network View via an [Actisense NGT-1](#)).
2. Connect your PC / Mobile device to the W2K-1's Wi-Fi access point.

3. Once connected, open your web browser and search for the W2K-1's AP (Access Point) IP (192.168.4.1)
4. When connected, you will be presented with the following home page:

Using OpenCPN with the Actisense W2K-1

- From here, enter Settings > Data Server Settings. You may need to login, in which case the Username and Password is 'admin', unless this has been changed by the owner / installer.
- In the Data server menu, you will be presented with 3 data servers. At least one of these needs to be set up to NMEA 0183 Format. The Data direction is dependent on what you are using the W2K-1 with OpenCPN for. If you are only using the W2K-1 to send data to OpenCPN, then the direction can be set to Transmit Only. However, if you also want OpenCPN to send data such as waypoints back to the W2K-1, then set the direction to 'Both'. Once you are happy, hit the 'Update' button.

Data Server

Server	Format	Direction	Protocol	Port
Server 1 <input checked="" type="checkbox"/>	NMEA0183	Receive Only	TCP	60001
Server 2 <input checked="" type="checkbox"/> ...	NGT Actisense	Transmit Only	TCP	60002
Server 3 <input checked="" type="checkbox"/>	NMEA0183	Both	TCP	60003

Warning! Update will refresh the data servers and restart firmware. You will lose connection to this web application temporarily.

Update

- With OpenCPN you can use any Port number on the W2K-1, which means they can be left on the default numbers. For this example, data server 1 will be used with OpenCPN, with Port Number 60001.

Setting up the connection in OpenCPN

- If you do not already have OpenCPN installed, it can be downloaded from [here](#).
- With OpenCPN downloaded and installed, run the program. You will be presented with the following screen upon startup:

Using OpenCPN with the Actisense W2K-1

3. Select the settings icon:

4. Go to the connections tab, this is where you will set up your IP connection with the W2K-1. Select 'add connection'.
5. Enter the IP and Port Number of the W2K + Data Server you are using:

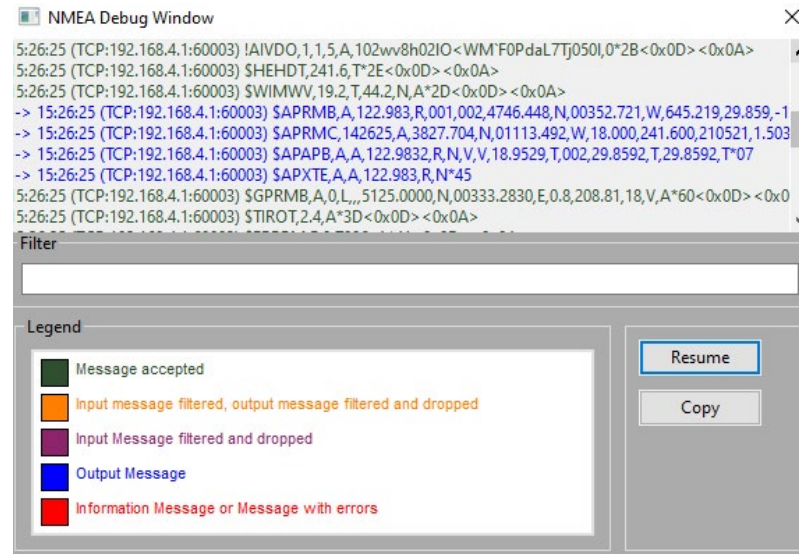

A screenshot of the OpenCPN connections configuration window. The 'Network' radio button is selected. The 'Protocol' section has 'TCP' selected. The 'Address' field contains '192.168.4.1' and the 'DataPort' field contains '60003'. The 'User Comment' field is empty. The 'Priority' dropdown is set to '1'. The 'Control checksum' checkbox is checked. The 'Receive Input on this Port' and 'Output on this port (as autopilot or NMEA repeater)' checkboxes are both checked. The 'Talker ID (blank = default ID)' field contains 'AP'. The 'APB bearing precision' dropdown is set to 'x.xxxx'. The 'Input filtering' section has 'Accept only sentences' selected. The 'Output filtering' section has 'Transmit sentences' selected.

6. If you want the connection to operate on both Transmit to the W2K-1 and Receive from the W2K-1, then the 'Receive Input on this port' and 'output on this port' must both be ticked.
7. One very useful tip we recommend is that you enable the NMEA Debug Window. This window will indicate the data that is being sent and received, and whether there are any errors, thanks to OpenCPN's easy to use sentence colour scheme.

A screenshot of the OpenCPN General settings window. The 'Filter NMEA Course and Speed data' checkbox is unchecked, and the 'Filter period (sec)' field contains '1'. The 'Show NMEA Debug Window' checkbox is checked. The 'Format uploads for Furuno GP3X', 'Use Garmin GRMN (Host) mode for uploads', and 'Use magnetic bearings in output sentence ECAPB' checkboxes are all unchecked.

Using OpenCPN with the Actisense W2K-1

8. The debug window will show every sentence being sent and received and highlight any sentences in red if there is an error. Green is received sentences, and blue is transmitted sentences by OpenCPN:
